In computational science, particle swarm optimization (PSO) is a computational method that optimizes a  
problem by iteratively trying to improve a candidate solution with regard to a given measure of quality.

The choice of optimization algorithm for your deep learning model can mean the difference between good  
results in minutes, hours, and days. The Adam optimization algorithm is an extension to stochastic gradient  
descent that has recently seen broader adoption for deep learning applications in computer vision and natural  
language processing.

Systems Simulation: The Shortest Route to Applications. This site features information about discrete event  
system modeling and simulation. It includes discussions on descriptive simulation modeling, programming  
commands, techniques for sensitivity estimation, optimization and goal-seeking by simulation, and what-if  
analysis.

This course introduces students to the theory, algorithms, and applications of optimization. The optimization  
methodologies include linear programming, network optimization, integer programming, and decision trees.  
Applications to logistics, manufacturing, transportation, marketing, project management, and finance.  
Includes a team project in which students select and solve a problem in practice.

Stochastic optimization (SO) methods are optimization methods that generate and use random variables. For stochastic problems, the random variables appear in the formulation of the optimization problem itself, which involve random objective functions or random constraints.
