A transformer is a static electrical device that transfers electrical energy between two or more circuits. A varying current in one coil of the transformer produces a varying magnetic flux, which, in turn, induces a varying electromotive force across a second coil wound around the same core.

## **Transformer - Wikipedia**

Electricity is the set of physical phenomena associated with the presence and motion of matter that has a property of electric charge. In early days, electricity was considered as being not related to magnetism.

In-service stator winding failures on deep well pump induction motors [Libya]: Water was circulated round the pump motor by an elementary centrifugal pump - with water being drawn in along the axis of the rotor and pumped out towards one stator end winding by centrifugal action through four holes placed around the rotor shaft.
