The Department of Chemical Engineering and Biotechnology at Cambridge University is one of the UK's leading research departments, ranking highly in both national and international University league tables. The department's research strategy responds to the global drive for sustainability, addressing the need for novel chemical engineering and biotechnology processes and materials.

In a chemical reaction, chemical equilibrium is the state in which both reactants and products are present in concentrations which have no further tendency to change with time, so that there is no observable change in the properties of the system. Usually, this state results when the forward reaction proceeds at the same rate as the reverse reaction.

This paper reviews the current pathways for recycling of solid plastic waste, via both mechanical and chemical recycling. The predominant industrial technologies, design strategies and recycling examples of specific waste streams are reviewed.

### **Mechanical and chemical recycling of solid plastic waste**

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
