Neets Module 10-Introduction to Wave Propagation, Transmission Lines

Electric power transmission is the bulk movement of electrical energy from a generating site, such as a power plant, to an electrical substation.

The velocity factor (VF), also called wave propagation speed or velocity of propagation (VoP or v_p), of a transmission medium is the ratio of the speed at which a wavefront (of an electromagnetic signal, a radio signal, a light pulse in an optical fibre or a change of the electrical voltage on a copper wire) passes through the medium, to the speed of light in a vacuum.

Introduction: By increasing population of the world, towns are expanding, many buildings construct near high voltage overhead power transmission lines. The increase of power demand has increased the need for transmitting huge amount of power over long distances. Large transmission lines configurations with high voltage and current levels generate large values of electric and magnetic fields.
